Sustainability, less waste, shorter cycle times, higher energy efficiency, green buildings and all of that at lower costs, these are the demands the housing industry in North America is facing today. Among the different approaches to these subjects, design for manufacturing combined with prefabrication of buildings definitely is the most promising solution.

Working in prefabrication in the residential and commercial housing industry in Europe, North and South America since 1993 we are your reliable partner for CAD-CAM-solutions, CNC-machine control, factory layout, software implementation, design integration and quality assurance systems. Graduated with engineers' diplomas in Wood-Engineering from the University of Applied Science in Rosenheim, Germany. Working for various companies in Germany, Canada, USA and Brazil, we have the knowledge, the background and the experience to support you as well in setting up your solution to solve today's challenges. Teaming up with SEMA, the market leader in timber framing software, and representing them in North America, we provide know-how, consultation and hotline-support on the spot.

By trading our customers with respect and faith, basing our work ethics on reliability and perseverance and believing in honesty and integrity, we grow through creativity, invention and innovation. Contact us today and find out how we can help you!

Alfred Porsche
